

Naming Binary Covalent Compounds

Aim

- name compounds formed from nonmetals

Notes

Identifying the metal

- ★ Binary compounds consist of two elements – a metal and a nonmetal – but
- ★ Binary compounds can also form between two nonmetals by covalent bonding
 - ☆ nonmetals can behave like metals and have positive oxidation states
 - ☆ In compounds between two nonmetals, the element with the lower electronegativity behaves as the metal

Naming binary covalent compounds

- ★ the metal is written first in the name and the formula
 - ☆ the name of the metal is the same as the name of the element (S = sulfur, S⁺⁴ = sulfur)
 - ☆ if there is more than one atom of the metal, the number of atoms is indicated with a prefix
- ★ the nonmetal is written last in the name and formula
 - ☆ the name of the nonmetal is the same as the name of the element minus the final syllable or two, plus IDE (O = oxygen, O⁻² = oxide)
 - ☆ the number of nonmetal atoms is indicated with a prefix (even when there is only one)
- ★ examples
 - ☆ CO - carbon monoxide
 - ☆ CO₂ - carbon dioxide
 - ☆ N₂O₅ - dinitrogen pentoxide (*NOTE*: the “a” in penta is dropped to avoid putting two vowels together)
 - ☆ SO₃ - sulfur trioxide
 - ☆ SiCl₄ - silicon tetrachloride

Number of Atoms	Prefix
1	mono
2	di
3	tri
4	tetra
5	penta
6	hexa
7	hepta
8	octa
9	nona
10	deca

Answer the questions below by circling the number of the correct response

- The formula for sulfur hexafluoride is (1) SHF, (2) SF, (3) SF₆, (4) S₆F.
- The IUPAC name for N₂O₃ is (1) dinitrogen trioxide, (2) nitrogen oxide, (3) nitrogen trioxide, (4) dinitrogen oxide.
- The prefix used to show there are four atoms of an element in a binary covalent compound is (1) quadra, (2) recta, (3) hepta, (4) tetra.
- Which of the following is a binary covalent compound? (1) Na₂O (2) P₂S₅ (3) Hg₂Cl₂ (4) KI
- Name SiBr₄ _____
